JUST AI TALKING INFOCAST

Is your website safe?

Two critical PHP flaws were fixed on 21 October. What a small business needs to know, without the jargon.

Swipe for more

1

Updating WordPress isn’t enough

WordPress, its plugins and its theme don’t update PHP. The fix goes on the server, which usually means your host.

2

How to check your PHP version

In WordPress: Tools, Site Health, Info, Server. Then send the number to whoever looks after your site.

3

No DIY fixes

Don’t install an unofficial “fix” plugin or paste in code from a forum.

Updating is the only safe choice.

4

Three questions to ask

Has the 21 October fix been installed?

Has anyone checked nothing got in before it?

Should we change any passwords?

Get it in writing

A written answer that the fix is done, with the date.
